PROFILE

Systems-oriented software engineer and open-source maintainer who turns ambiguous problems into operable systems. Work spans Python services, Linux hosts, rootless containers, application security, applied AI, desktop software, and games. Default rhythm: **spike** → **iterate** → **stabilize**.

EXPERIENCE

Core Maintainer & Security Manager

Ongoing [↗](#)

Odysseus · open source / volunteer

- Work across authorization, owner isolation, fail-closed behavior, token scoping, path confinement, model routing, OAuth, CI, and regression coverage.
- Review high-risk changes by reconstructing invariants across code, state, tests, persistence, and authorization boundaries; reproduce failures and probe the smallest safe fix.
- Build specifications and review tooling that make security-sensitive work evidence-bound, resumable, and safer to execute.

Independent Software Builder

Ongoing [↗](#)

Small Loop Works & open-source projects

- Build and release cross-platform desktop, ML, local-agent, native C, and Godot projects from rough prototype through tests, specifications, automation, and public artifacts.
- Operate supporting Linux hosts, rootless Podman workboxes, SSH/Tailscale access, systemd recovery, cloud GPU experiments, and release flows.

SELECTED PROJECTS

Review Ops

Python · Podman · Git · security

Private resumable review harness: pinned Git ranges, hashed evidence, hostile-input handling, bounded subprocesses, secretless offline probes, and human-controlled publication.

DJ Blue AI

PySide6 · audio · applied AI [↗](#)

Cross-platform meeting, playback, transcript, and AI chat application with persistent configuration, component previews, smoke tests, and tagged releases.

Chess Bot

PyTorch · data pipelines · cloud GPU [↗](#)

Dataset generation and validation, model training, top-k and legality metrics, inference, local play, and RunPod/Vast lifecycle orchestration.

Code Review Simulator

Godot · simulation · release [↗](#)

Playable indie game taken from unusual premise to working core loop, cross-platform builds, public devlogs, and a browser release.

CORE STACK

LANGUAGES

Python, C/C++, Bash, assembly-like languages

SYSTEMS

Linux, Podman, Docker, systemd, SSH, Tailscale, Git, CI/CD, GitHub Actions

AI / DATA

PyTorch, LangGraph, RAG, Qdrant, NLP, embeddings, model training & evaluation

APPS / NATIVE

PySide6, Qt, CMake, SDL2, Godot, SQLite, cross-platform packaging

PRACTICE

Application security, deep code review, automated testing, specifications, technical documentation

MORE WORK

- Local agent tools: LangGraph, Qdrant, llama.cpp
- Word2Vec Pro Kit: PyTorch, mmap, Safetensors
- Clean Mines: C, SDL2, CMake
- 4-bit CPU: digital logic & custom ISA exploration

“Start in ambiguity; leave behind a working system someone else can understand and continue.”
